

## CENTER FOR TURBULENCE RESEARCH SUMMER RESEARCH OPPORTUNITY

July 6-August 1, 2008

<http://ctr.stanford.edu>

The Center for Turbulence Research invites applications for participation in its twelfth biennial summer research program. The objective of the program is to promote the development and evaluation of new ideas in turbulence research. It is expected that novel ideas and preliminary results generated during the summer program will be of sufficiently high caliber to lead to publications and to provide the grounds for new research in the participants' home institutions.

Interested scientists may consider submitting proposals in general areas of turbulence research. Examples of areas currently under study at CTR are: Large Eddy Simulation (LES) of turbulent combustion, Reynolds Averaged Navier-Stokes (RANS) simulations in aeronautical/industrial applications, modeling and simulation of fires, LES of convection in solar-type stars, wall boundary conditions for high Reynolds number LES, sub-filter modeling, aerodynamic noise and hydroacoustics, aero-optics, flow control and optimization, spray combustion and multi-phase turbulent flows, turbulent mixing, turbomachinery flows, transition and turbulence in non-equilibrium hypersonic boundary layers, turbulent coupled non-equilibrium/MHD/radiation flows, shock waves, radiative transfer, astrophysical flows, error estimation and uncertainty quantification in numerical simulations, numerical algorithms for complex flows and for emerging computer architectures, and novel data mining techniques.

Participants will have the unique opportunity to make use of the Center's advanced numerical simulation technology including an unstructured code for multi-phase reacting flows in complex configurations. Computer expertise is not essential, and applications from experimentalists and theoreticians are encouraged. Scientific staff members and graduate students, highly skilled in computer programming and familiar with the Center's post-processing systems, will provide support. Faculty applicants may propose to have their own advanced doctoral students accompany them.

The available CTR databases include velocity, pressure, vorticity, and scalar fields in several compressible and incompressible flows. Three-dimensional fields at several instants and some time series are available for each flow. Several multiprocessor SGI Origin 300 supercomputers, Linux HPC clusters ranging from 96 to 1,600 cores, numerous graphics workstations and a visualization system with a 16 tile display for 3-D data analysis will be available to the participants. Some participants in the recent past summer programs have used their own databases and codes. Although most of the summer program will be based on existing data, a few new cases suggested by the participants may be carried out in preparation for the summer program.

Approximately forty participants will be selected on the basis of their research ideas and the overall synergistic potential of the group. Fellowships will provide appropriate support, including travel and a stipend based on the full-time and concurrent salaries from the home institution. Potential applicants unfamiliar with the CTR summer programs and the format of the program and examples of research performed in should visit the CTR web site: <http://ctr.stanford.edu>.

### **Application Procedure:**

Applicants should submit a brief proposal stating the fundamental questions to be addressed and/or the data and the computer codes to be employed, along with financial requirements; include a current vitae.

Applications must be received by January 27, 2008. Awards will be announced on February 25, 2008. Housing arrangements will be made thereafter.

### **Write to:**
